

2019 年度 微積分 II 出席カード兼小テスト No. 7

2019.11.22

学生証番号 ( ) 氏名 ( )

1 関数  $f(x, y) = \sqrt{1 + 2x + 4y}$  の原点  $(0, 0)$  における 2 次の近似多項式  $P_2(x, y)$  を求めよ.

(解)  $g(t) = \sqrt{t}$  とおくと,

$$\frac{dg}{dt}(t) = \frac{d}{dt} \left[ t^{\frac{1}{2}} \right] = \frac{t^{-\frac{1}{2}}}{2}, \quad \frac{d^2g}{dt^2}(t) = \frac{d}{dt} \left[ \frac{t^{-\frac{1}{2}}}{2} \right] = -\frac{t^{-\frac{3}{2}}}{4}$$

であることに注意したい.  $f(x, y) = g(1 + 2x + 4y)$  より

$$\begin{aligned} \frac{\partial f}{\partial x}(x, y) &= \frac{dg}{dt}(1 + 2x + 4y) \cdot 2 = \frac{1}{\sqrt{1 + 2x + 4y}}, \\ \frac{\partial f}{\partial y}(x, y) &= \frac{dg}{dt}(1 + 2x + 4y) \cdot 4 = \frac{2}{\sqrt{1 + 2x + 4y}}, \\ \frac{\partial^2 f}{\partial x^2}(x, y) &= \frac{d^2g}{dt^2}(1 + 2x + 4y) \cdot 2 \cdot 2 = -\frac{1}{(1 + 2x + 4y)^{\frac{3}{2}}}, \\ \frac{\partial^2 f}{\partial x \partial y}(x, y) &= \frac{d^2g}{dt^2}(1 + 2x + 4y) \cdot 2 \cdot 4 = -\frac{2}{(1 + 2x + 4y)^{\frac{3}{2}}}, \\ \frac{\partial^2 f}{\partial y^2}(x, y) &= \frac{d^2g}{dt^2}(1 + 2x + 4y) \cdot 4 \cdot 4 = -\frac{4}{(1 + 2x + 4y)^{\frac{3}{2}}} \end{aligned}$$

であるから,

$$\begin{aligned} f(0, 0) &= 1, & \frac{\partial f}{\partial x}(0, 0) &= 1, & \frac{\partial f}{\partial y}(0, 0) &= 2, \\ \frac{\partial^2 f}{\partial x^2}(0, 0) &= -1, & \frac{\partial^2 f}{\partial x \partial y}(0, 0) &= -2, & \frac{\partial^2 f}{\partial y^2}(0, 0) &= -4 \end{aligned}$$

が得られ,

$$\begin{aligned} P_2(x, y) &= f(0, 0) + \frac{1}{1!} \left\{ \frac{\partial f}{\partial x}(0, 0) x + \frac{\partial f}{\partial y}(0, 0) y \right\} \\ &\quad + \frac{1}{2!} \left\{ \frac{\partial^2 f}{\partial x^2}(0, 0) x^2 + 2 \frac{\partial^2 f}{\partial x \partial y}(0, 0) x y + \frac{\partial^2 f}{\partial y^2}(0, 0) y^2 \right\} \\ &= 1 + x + 2y - \frac{x^2}{2} - 2xy - 2y^2 \end{aligned}$$

となる. ■
